Caveat

a. We are very early in the development cycle

b. Features are very limited

c. Some bugs may exist

Navigating Through the Views

- ➤ Icons at the top handle main navigation
- ➤ You can move in any direction
- ➤ Hover over an icon will tell you what the view is

The Project Tree

- Located in the top right

- Displays datasets that you have loaded into your session

- Displays results that you have calculated

- Right now, you can interact with these objects by right-clicking

- In the future you will be able to smartly drag/drop these objects and the display will be more informative

Using the Visualizations

➤ The displays are created automatically

➤ Map allows for layers, but currently only implement a single coloring scheme (analysis results are handled differently)

➤ Currently if you want to change a visualization, re-add the data to the visualization

➤ In the future you will be able to customize the appearance of the displays and change the data from the visualization itself

Running an Analysis

→ Only appropriate data can be used (we aren't yet checking for variable types)

→ Analyses are fairly swift, results are visualized automatically
